

CHANGELOG

This file lists all the updates made to our The Ultimate Space-Time Travel Planner project. It highlights the equal contributions and tasks completed by each group member.

Version v1.2.2 – September 12, 2026 • Now displays distance between Earth and the selected destination (Contributed by Jaden Lawrence O. Yusiong)

Version v1.2.1 – September 8, 2026 • Added new planets (Contributed by Ronand Jeth E. Macapanas)

Version v1.1.0 – September 4, 2026 • Fixed bug where the program crashed if no input was given when prompt was blank by applying a logical default value. Added dynamic calculation changes to shift rocket calendar metrics securely via datetime tracking. (Contributed by Jaden Lawrence O. Yusiong)

Version v1.0.2 – September 2, 2026 • Adjusted planetary metrics display using math equations to show only two decimal places for gravity factors. Fixed crash issues where strings or symbols were typed into the numeric fields by creating valid try-except check blocks. (Contributed by Lyan Ezekiel P. Tolentino)

Version v1.0.1 – August 30, 2026 • Improved terminal flight loops to display structured countdown hour metrics cleanly for users. Added math.floor function logic blocks to round down target cosmic weight results into neat whole numbers. (Contributed by Lyan Ezekiel P. Tolentino)

Version v1.0.0 – August 28, 2026 • First version of the program. Initial baseline setup allowing choices among distinct celestial bodies (Contributed by Ronand Jeth E. Macapanas)
